

World Resources Institute Research Report Climate change and land use are among the most pressing environmental challenges facing humanity today. This report examines recent findings on deforestation rates, carbon sequestration potential, and sustainable agriculture practices across tropical regions. Our analysis draws on satellite imagery, ground-truth surveys, and peer-reviewed literature to assess the effectiveness of conservation interventions. Key findings indicate that integrated land-use planning can reduce emissions while supporting rural livelihoods and biodiversity goals simultaneously. Policymakers and investors are encouraged to adopt evidence
